the book describes two stages in the historical development of the notion of mathematical structures first it

traces its rise in the context of algebra from the mid nineteenth century to its consolidation by 1930 and then it considers several attempts to formulate elaborate theories after 1930 aimed at elucidating from a purely mathematical perspective the precise meaning of this idea first published in the series science networks historical studies vol 17 1996 in the second rev edition the author has eliminated misprints revised the chapter on richard dedekind and updated the bibliographical index

the present book is based on the extensive lecture notes of the author and contains a concise course on linear algebra the sections begin with an intuitive presentation aimed at the beginners and then often include rather non trivial topics and exercises this makes the book suitable for introductory as well as advanced courses on linear algebra the first part of the book deals with the general idea of systems of linear equations matrices and eigenvectors linear systems of differential equations are developed carefully and in great detail the last chapter gives an overview of applications to other areas of mathematics like calculus and differential geometry a large number of exercises with selected solutions make this a valuable textbook for students of the topic as well as lecturers preparing a course on linear algebra

the purpose of this unique handbook is to examine the transformation of the philosophy of mathematics from its origins in the history of mathematical practice to the present it aims to synthesize what is known and what has unfolded so far as well as to explore directions in which the study of the philosophy of mathematics as evident in increasingly diverse mathematical practices is headed each section offers insights into the origins debates methodologies and newer perspectives that characterize the discipline today contributions are written by scholars from mathematics history and philosophy as well as other disciplines that have contributed to the richness of perspectives abundant in the study of philosophy today who describe various mathematical practices throughout different time periods and contrast them with the development of philosophy editorial advisory board andrew aberdein florida institute of technology usa jody azzouni tufts university usa otávio bueno university of miami usa william byers concordia university canada carlo cellucci sapienza university of rome italy chandler davis university of toronto canada 1926 2022 paul ernest university of exeter uk michele friend george washington university usa reuben hersh university of new mexico usa 1927 2020 kyeong hwa lee seoul national university south korea yuri manin max planck institute for mathematics germany 1937 2023 athanase papadopoulos university of strasbourg france ulf persson chalmers university of technology sweden john stillwell university of san francisco usa david tall university of warwick uk 1941 2024 this book with its exciting depth and breadth illuminates us about the history practice and the very language of our subject about the role
